

Think about it ...

- More than 75 percent of those over age 35 will be affected by some form of periodontal (gum) disease.¹
- Poor oral health can make diabetes harder to control, resulting in infections that lead to higher blood-sugar levels.²
- Those with untreated periodontal disease have up to a two-fold increased risk for heart disease.³
- Advanced gum disease affects 4 percent to 12 percent of adults.⁴
- By looking in the mouth, a dentist can detect more than 120 disease symptoms.⁵
- Pregnant women with gum disease may be seven times more likely to deliver premature, low-birth-weight babies.⁶
- Periodic oral cancer screening examinations can lead to early detection and improved outcomes.

ORAL HEALTH FOR TOTAL HEALTH

Dental health can influence conditions such as diabetes, oral cancer, coronary artery disease (CAD), and low-birth weight and premature babies. There's a relationship between a healthy mouth and overall good health. That means it's important to get regular preventive dental care to help maintain your good oral health and overall health.

HMSA is committed to our community and the health of our members. That's why we support a multifaceted approach to optimum oral care called Oral Health for Total Health. Because we offer medical and dental plans, we can analyze claims information and identify members who can benefit from focused attention and additional dental education.

The condition-specific benefits of our Oral Health for Total Health program include:

- Delivering an oral health education campaign to members, providers, and employers.
- Identifying members with diabetes, heart disease, or oral cancer, and those who are pregnant, for more specific education.
- Working with members who aren't actively maintaining their oral health through focused communication that encourages them to see their dentist.
- Removing financial barriers through Enhanced Dental Benefits, a program that provides at-risk members with condition-specific benefits beyond their dental benefits.
 - No copayment.
 - No deductible.
 - Covered outside the annual maximum.

Enhanced Dental Benefits

Enhanced benefits are paid at 100 percent and are not subject to deductibles, coinsurance, or calendar-year maximums when performed by a participating or preferred dental provider.

Enhanced Dental Benefits				
	Cleaning or periodontal maintenance visit every 3 months	Periodontal scaling once per quadrant every 24 months*	Prediagnostic oral cancer screening every 6 months	Fluoride treatment every 3 months
Diabetes	✓	✓		
Coronary Artery Disease	✓	✓		
Pregnancy	✓	✓		
Oral Cancer**	✓		✓	✓

* Periodontal maintenance and scaling available with plans that offer periodontal benefits.

** Oral cancer benefit available for members who have had a previous diagnosis of oral cancer.

Please note: Members are subject to eligible plan benefits and applicable waiting periods prior to obtaining Enhanced Dental Benefits.

Brush up on your oral health knowledge. Visit hmsa.com/oralhealth to learn more.

A focus on good dental care can help avoid major health issues.

Coronary Artery Disease

Researchers have found that people with periodontal or gum disease are almost twice as likely to have coronary artery disease. There are several theories of how this happens. When bacteria from the mouth enter the blood vessels, they attach to fatty proteins, which may lead to blood clots and plaque build-up. Inflammation caused by periodontal disease could also increase plaque build-up, which may cause arteries to narrow and harden. Gum disease can also exacerbate existing heart conditions.

Diabetes

The relationship between periodontal disease and diabetes goes both ways. Those with diabetes are more susceptible to periodontal disease, and periodontal disease may increase blood-sugar levels and complications for those with diabetes. Periodontal disease may also increase the progression of prediabetes and can increase insulin resistance and disrupt glycemic control.

Low-Birth Weight and Premature Birth

Pregnant women may have red, tender gums that are likely to bleed. This condition is known as pregnancy gingivitis and occurs when rising hormone levels make the gums more sensitive to plaque. This inflammation may increase the likelihood of a woman having a premature, low-birth weight baby.

Oral Cancer

People with a history of oral cancer are at risk for developing new primary lesions. Additional benefits will help dentists identify suspicious oral lesions early for possible treatment, as well as treat the side effects of previous oral cancer treatment.
